INTERPRETATION*

This survey is designed to help you reflect on your relationship with food. “Normal” eating is flexible. It varies in response to emotions, daily activities, hunger and proximity to food.

Scores between 0 and 3. These scores generally indicate a healthy attitude toward food and eating.

Scores between 4 and 8. These scores suggest that cultural pressures about appearance and ideas about how much and what kinds of foods to eat may be negatively affecting self-acceptance and overall happiness. Exploring these issues may be helpful.

Scores between 9 and 12. These scores suggest serious issues with food, ranging from food obsession to an eating disorder. These issues could be interfering with daily life and may negatively affect overall health. Professional assistance is recommended to deal with thoughts, feelings, and behaviors related to food and body image. Medical evaluation and intervention may also be needed to address health concerns.

***Note:** The “Healthy Relationship with Food” quiz can only give results based on the limited number of questions asked. It cannot account for the truthfulness of the answers, only for self-reporting of each participant. The interpretations given are for informational and educational purposes only, and do not constitute or substitute for any psychological and medical evaluations performed by a qualified professional, nor for any psychological or medical treatment. If psychological or medical evaluation and treatment are indicated, immediately consult a qualified professional.
